

## **Laurel Meters**

Laurel Electronics, Inc. designs and manufactures highly capable electronic instruments for industrial measurement, control and networking. Our programmable digital panel meters, electronic counters, digital controllers, industrial timers, transmitters, and large-digit data displays set the standard of the industry with technical features and performance. Our newest products can be networked via RS485, USB or Ethernet using the Modbus protocol. We also continue to support RS232 and 4-20 mA current loops with new products such as our new serial-to-analog converter and our new isolating quad loop splitter. Most of our products are designed and manufactured in our headquarters facility, which is located adjacent to Orange County Airport in Southern California.
